Creación de aplicación usando el patrón serverless

Módulo: Contenerización de Aplicaciones de Software · Unidad 4 · Actividad Sumativa

Video explicativo (público)	https://www.youtube.com/watch?v=cKFu1Bos6qs
Aplicación desplegada	https://pokedex-serverless.pokedex-maestria.workers.dev/

2. Descripción

Se descargó el dataset público *Pokemon with stats* (800 filas, 13 columnas, CSV), se cargó completo en una base de datos serverless (**Cloudflare D1**) y se desarrolló una aplicación web serverless que permite visualizar los datos en tarjetas, buscarlos por **ID** (llave primaria) o por **nombre** (columna única), filtrarlos por tipo, generación y legendarios, y ver una gráfica con el promedio de puntos por tipo.

Capa	Servicio	Archivo	Por qué
Presentación	Workers Static Assets	public/	Sitio estático servido desde la red global, sin servidor propio
Lógica	Cloudflare Workers (función serverless)	src/worker.js	Se ejecuta solo cuando llega una petición; escala sola; el navegador nunca habla directo con la base de datos
Datos	Cloudflare D1 (SQL serverless)	db/schema.sql, db/seed.sql	El dataset es tabular (CSV), por lo que encaja en SQL; sin servidor de base de datos que administrar

La columna original «#» se repite (solo 721 valores distintos en 800 filas, por las mega-evoluciones), por eso la tabla usa un `id` propio como llave primaria y `name` (única) como columna secundaria de búsqueda.

3. Script de la base de datos

Estructura de la tabla `db/schema.sql`

```
-- ======================================================================
-- Estructura de la base de datos serverless (Cloudflare D1, motor SQLite)
-- Dataset: Pokemon with stats (800 filas, 13 columnas originales)
--
-- Notas de diseno:
--   * "id" es la llave primaria propia (1..800). La columna original "#"
--     NO es unica (las mega-evoluciones repiten el numero), por eso se
--     guarda aparte como "dex_number".
--   * "name" es UNICA: sirve como columna secundaria de busqueda.
--   * "type2" admite NULL (muchos pokemon tienen un solo tipo).
--   * "legendary" es booleano guardado como 0/1 (SQLite no tiene BOOLEAN).
-- ======================================================================

DROP TABLE IF EXISTS pokemon;

CREATE TABLE pokemon (

  name        TEXT    NOT NULL UNIQUE,      -- nombre unico

  attack      INTEGER NOT NULL,
  defense     INTEGER NOT NULL,

  sp_def      INTEGER NOT NULL,             -- columna original "Sp. Def"
  speed       INTEGER NOT NULL,
  generation  INTEGER NOT NULL,             -- generacion 1..6
